We have decided to only cache the browse page. The reason for this is because this will probably be the most used page. It has a cache control of public and a max age of 10 minutes. The reason why the cache control is public is because we want proxies to also be able to cache it so that the response is faster.

It also has a max age of 10 minutes only because we don't expect people to browse the items for too long. It's a coffee shop and they should have a quick idea of what they want to order.

Before Caching Takes Place:

Response time: 387 ms

After Caching:

Response time: 7.4 ms
